Welcome!

How many times have you come up against a business requirement that isn't fully supported by your application framework or toolkit? Uploading large files, running background processes, jQuery sugar, virus scanning - eventually you'll need something that the template doesn't provide. There's no need to re-invent the wheel, just start with one of the following proven solutions.

Contributing

Have you solved an interesting problem that others would find helpful? Post your solution as follows:

1. Add a link from this page to your (new) solution page. The page title (identifier) should start with "Solution", e.g., "Solution: Uploading Large Files in ASP.NET". Make sure to add the link to the appropriate section(s) below.
2. On your solution page, you should cover the following topics:

- Problem: What would lead someone to need this solution?
- Description: A few sentences describing how the solution is implemented, what it does and how. Include a picture if it helps.
- Walkthrough: Step-by-step instructions for adding the solution to an existing code base. Include screen shots, command line entries, scripts or code snippets as appropriate.
- Files: Add links to the file(s) required to implement the solution. You can link to files on the wiki (to store the files here), GForge downloads or a web address.
